MY TAKE ON BITCOIN THIS WEEK

A PERSONAL VIEW · 17–24 JUNE 2026

Published 24 June 2026

I'll be honest with you: this was not a fun week to be watching Bitcoin. And yet, sitting here on 24 June, I find myself more *interested* in what just happened than I am scared of it. Let me tell you why.

THE WEEK THAT RATTLED EVERYONE

Bitcoin bled from around $67,000 down to a hair above $59,000. That's a gut-punch move, and the liquidation cascades — over $600 million wiped across crypto markets — made it feel worse than the numbers alone suggest. On Monday the 23rd, BTC shed over $2,500 in a single session, snapping below a trendline that had been holding since the June 5 rebound. The bearish head-and-shoulders pattern on the 4-hour chart that technicians had been nervously eyeing all week finally confirmed. Its measured target: approximately $57,500. That is a real risk. I won't pretend otherwise.

But here is what I keep coming back to: this didn't happen because something broke *inside* Bitcoin. It happened because of everything outside it.

AT A GLANCE

BTC Week Range	$59,000 – $67,000
Liquidations (week)	>$600M
ETF Outflows (June)	>$2.8B
Strategy STRC Low	$82.53 (vs $100 par)
Fear & Greed Index	23 — Extreme Fear
H&S Target	~$57,500

WHY I'M NOT PANICKING — BUT I'M NOT BUYING YET EITHER

The selloff was driven by a genuinely awful stack of external forces. The Fed has turned hawkish again — nine of eighteen FOMC members now expect rate hikes in 2026 — which is arguably the worst macro backdrop for a speculative asset. Then AI and chip stocks got hit hard. Oil collapsed on Iran deal rumours. Suddenly everything risk-adjacent was bleeding at once. Saylor himself pointed to $400 billion rotating into AI infrastructure this year as a structural headwind. That's not conspiracy — it's competition for investor dollars.

> ***"What I find more meaningful than any of that, though, is the ETF story."***

Over $2.8 billion has left Bitcoin ETFs in June — the worst sustained redemption since they launched in early 2024. When those funds redeem, BlackRock and Fidelity have to sell actual Bitcoin into the market. Mechanical. Indifferent. It doesn't care about your thesis or your long-term conviction. When you have that kind of structural selling, no amount of on-chain optimism holds the price up in the short run.

So no — I'm not buying here with both hands. Not yet.

THE STRC SITUATION: OVERBLOWN, BUT NOT IRRELEVANT

I've seen a lot of people on social media screaming 'Terra 2.0' about Strategy's STRC preferred stock, which crashed to $82.53 this week against its $100 target. I think that comparison is lazy and wrong — STRC is equity, not an algorithmic stablecoin, and it has no peg to defend in the way UST did. Benchmark's analyst Mark Palmer is right to push back on that framing hard.

But here's the thing: you don't need STRC to be Terra for it to be a real problem. Strategy's model only works when STRC trades at or above $100. Right now it doesn't, so the Bitcoin buying machine has stalled. With nearly $1.7 billion in annual dividend obligations running regardless of where Bitcoin trades, the pressure on Saylor to eventually sell BTC is real and growing. When he sold just 32 coins in early June — 0.003% of his stack — MSTR fell 6% in a day. The market is terrified of what systematic forced selling from the world's largest corporate Bitcoin holder would do. Honestly, so am I. This is the story I am watching most closely over the next 30 days.

THE CLARITY ACT: THE GAME-CHANGER NOBODY IS TALKING ABOUT ENOUGH

Congress put the CLARITY Act on the Senate calendar on 1 June. It is the most significant crypto regulation bill in US history, and it needs a 60-vote floor majority it doesn't clearly have. The fight is genuinely frustrating to watch — Democrats are blocking over an ethics clause about government officials' crypto holdings (a not-unreasonable concern given the current administration's interests), and the White House won't accept language targeting specific officeholders. Impasse.

People are under-pricing what passage would actually mean. Ric Edelman's claim that it could unlock 95% of institutional capital still outside crypto sounds hyperbolic, but the directional logic is solid: banks and pension funds aren't absent from crypto because they lack interest. They're absent because their compliance teams won't let them near anything without a clear legal framework. The CLARITY Act would change that overnight.

> ***"Prediction markets put passage at 59–72% by year-end. My personal read: closer to 55%. But if it passes, Bitcoin doesn't hang around at $62,000 for long."***

WHERE I THINK THIS GOES

Here is my honest view: we are probably not done going down. The $60,000 level is critical, and I think it gets tested seriously — possibly broken — before this phase ends. The halving-cycle model puts a historical capitulation marker on 6 July and a potential bottom window in early September. That lines up with what I'm reading in sentiment and on-chain data: the Fear & Greed Index sits at 23 (extreme fear), and for the first time this cycle, more than half of all BTC in existence is held at a loss. Those aren't buy signals yet. But they're the kind of readings that precede them.

The one genuinely encouraging thing I saw this week: long-term Bitcoin holders — the real OGs, people who bought five or more years ago — have reduced their selling to a 19-month low. The people who have been through every cycle and come out the other side are not rushing for the exits. That matters to me more than any short-term technical pattern right now.

MY SCENARIO MAP

Outcome	Price Zone	What Would Need to Happen	My Odds
Recovery	$80K–$90K	CLARITY Act passes; ETF inflows return; Fed pivots	25%
Grind sideways	$57K–$65K	$60K holds; sentiment slowly rebuilds; STRC stabilises	50%
Deeper flush	$50K–$55K	Break below $59K; Strategy forced into BTC sales	20%
Worst case	$40K–$46K	Systemic contagion; CLARITY fails; hikes accelerate	5%

The three things I'm watching closely:

- **30 June** — Strategy's STRC dividend reset. A higher yield might stabilise the preferred stock and restart the Bitcoin accumulation engine.
- **6 July** — The 826-day post-halving marker. If the cycle model holds, this is where the final capitulation clock starts ticking.
- **Senate floor** — Any movement on the CLARITY Act vote is probably the single biggest near-term price catalyst in either direction.

I still believe in Bitcoin's structural story. Post-halving supply, maturing institutional rails, and eventual regulatory clarity are genuine long-term tailwinds. But right now, the market doesn't need your conviction. It needs time. And possibly one more scare below $60,000 before it can find a floor and mean it.
